

Graz, Mar 20, 2026

Dear Sir or Madam,

Please find enclosed my offer for the Revit tool "Verkaufspläne Generator".

As an architect, I have prepared sales plans manually on many real projects. Drawing on this experience, I developed structured workflows and tools to optimise and automate the process. I now offer this solution as a product that saves time while maintaining consistently high standards across all sales documentation.

The Revit add-in requires only basic Revit knowledge and can significantly reduce the work involved in preparing sales plans – often by several working days per project, particularly when changes arise in later project phases – while delivering consistent, reliable results.

If you find the tool useful but need minor adjustments or additional features, please contact me. Custom extensions can be developed to fit your existing workflow.

Yours sincerely

Damian Szyjka

Automated creation and updating of sales plans in Revit

Introduction

Preparing sales plans is a recurring task in many architectural projects. It often has to be completed under time pressure, is rarely a priority from a design perspective, and requires regular updates as the project progresses. At the same time, the plans must remain accurate, consistent and visually clear.

The **bimMajster Verkaufspläne Generator** automates the creation and updating of sales plans directly from the Revit BIM model. It allows architectural practices to reduce manual work significantly while maintaining consistently high quality across all sales documentation.

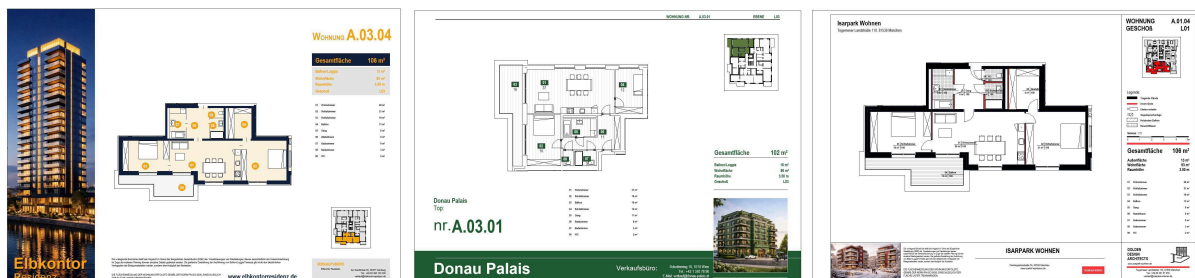

Verkaufspläne Generator automatically creates complete sales plan sheets using the project and room data in the BIM model. The workflow is fully integrated into Revit and requires **no external tools or additional scripting**.

About the author

I am an architect and computational design specialist with over ten years of professional experience using Autodesk Revit on architectural projects. During this time, I have developed numerous automation workflows, Dynamo scripts and Revit add-ins to streamline repetitive documentation tasks and improve data quality.

Alongside my project work, I have supported users through official Autodesk support, gaining detailed insights into practical BIM challenges across projects of different sizes. Verkaufspläne Generator grew out of workflows I originally developed for my own projects.

Sample sales plans are included in the Revit sample file and can be reused and adapted to individual projects.

Key features include:

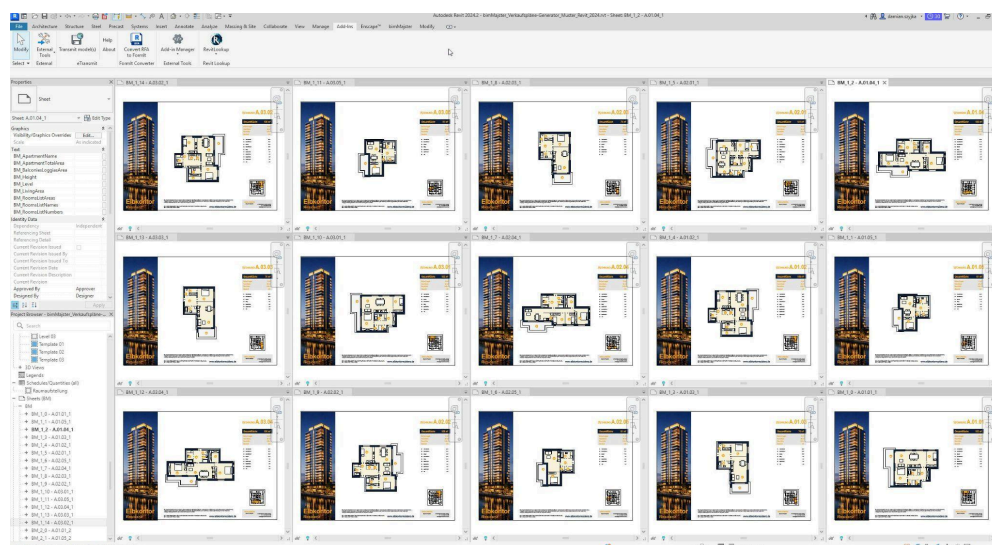

- Automatic creation of sales plans for each apartment
- Uniform layouts and consistent presentation across all sheets
- Automatic calculation of apartment areas from Revit parameters
- Fast regeneration at every project stage
- A separate update function for existing sales plans
- A fully parameter-based workflow using room data

Typical workflow

Sales plans are generated directly from the BIM model using room parameters and predefined project settings. Once created, the plans do not need to be rebuilt manually.

When the model changes, the **update function** recalculates all relevant values, updates sheet parameters and optionally adjusts view crops to the current geometry. Even late design changes can therefore be incorporated without creating new sheets or repeating manual calculations. In practice, manually preparing one sales plan page usually takes **30–60 minutes**, including view setup, area calculations, checking and corrections. In residential projects with **20–40 apartments**, initial preparation and subsequent revisions can add up to **20–50 working hours**, particularly when problems arise late in the project. With Verkaufspläne Generator, the same results can be generated or updated in **minutes rather than hours**, even after late changes.

Example: Sales plans generated in Revit with Verkaufspläne Generator

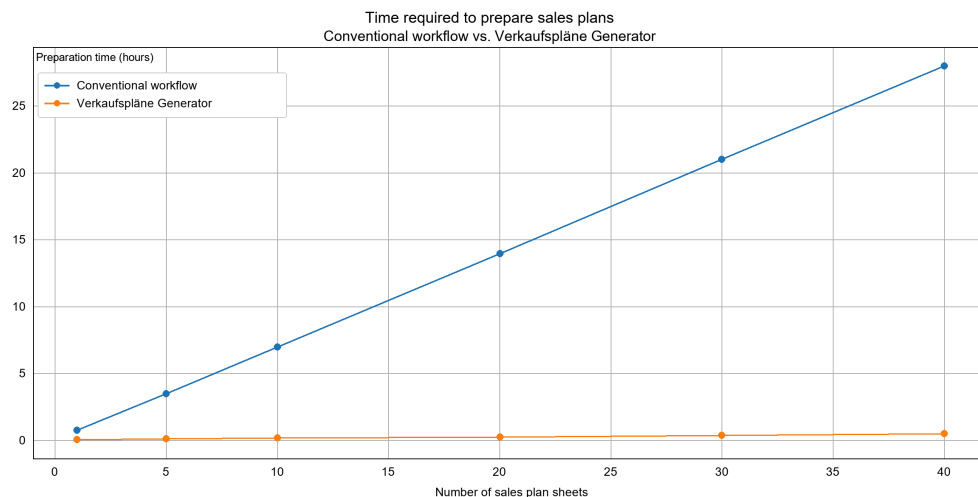

Why it matters

Verkaufspläne Generator offers clear benefits for architectural practices:

- Savings of 20–50 working hours per project (approximately 3–6 working days), depending on project size and the number of late changes
- Fewer manual calculation and copy-and-paste errors
- 100% consistent quality across all sales plans
- Late design changes incorporated without rework or new sheets
- Less repetitive, non-design work for architects
- Greater reliability under time pressure

Time required to prepare sales plans

In a conventional workflow, the time needed to prepare sales plans increases linearly with the number of sheets, typically taking 30–60 minutes per page. Verkaufspläne Generator produces the plans through an automated process, keeping the total effort almost constant even on larger projects.

Indicative values based on typical residential projects with 20–40 units.

Even on a single medium-sized residential project, the value of the working time saved when preparing sales plans will usually exceed the cost of the tool.

This makes the tool particularly valuable for practices working to tight deadlines or handling frequent changes late in a project.

Technical overview

- Fully integrated Revit add-in
- Parameter-based workflow using project and room data
- Supports generating sheets and updating existing sheets
- Compatible with multiple Revit versions (see the Autodesk App Store for details)

Links to a short video demonstration, a technical demo, the **Autodesk App Store** listing and the complete user manual are provided at the end of this document.
